# Part 1: Instructions

# 1. About the interim guidelines

## Overview

The Interim Accessibility Guidelines for Indoor and Outdoor Spaces (the interim guidelines) offer a way to identify barriers to accessibility in the built environment. They are “interim” because they will be replaced by a provincial accessibility standard for the built environment, which is now under development. The guidelines are not mandatory, but they can help public sector bodies begin their accessibility planning and be better prepared to meet the provincial standard when it is enacted.

Although this resource was developed for prescribed public sector bodies, it can also be useful for businesses, community organizations, and others committed to making their indoor and outdoor spaces more accessible for all Nova Scotians.

The interim guidelines reflect the highest standard set by either the Nova Scotia Building Code Regulations or Canadian Standards Association B651-18, *Accessible Design for the Built Environment*. They also include recommendations from nationally recognized sources, such as the *Rick Hansen Foundation Accessibility Certification (RHFAC) Ratings Professional Handbook*, and others.

## What is an accessibility audit?

An accessibility audit is an inspection of indoor and outdoor public spaces to systematically evaluate their accessibility for people of all ages and abilities. The key findings should inform the commitments for the built environment outlined in your organization’s accessibility plan.

**Note:** This resource was designed to be used in combination with the *Accessibility Planning Toolkit for Municipalities* and the *Accessibility Planning Toolkit for Prescribed Public Sector Bodies*. Refer to the toolkits for background about the Nova Scotia Accessibility Act (2017); the steps underway to make Nova Scotia an accessible province by 2030; definitions of key terms; and more. You can download the toolkits at [novascotia.ca/accessibility](https://novascotia.ca/accessibility).

The scope of the audit is determined by your organization's needs. Not all of the specifications outlined in these interim guidelines will apply to every organization. An organization may choose from these guidelines to audit some assets, and may choose another resource—such as the more detailed RHFAC guidelines—for other assets, such as buildings that are heavily used by the public. New buildings and significant renovations must comply with the latest version of the Nova Scotia Building Code Regulations.

## Using the audit worksheets

The interim guidelines are organized into two main parts:

- Sections 1 to 3 describe how to use the guidelines to do an audit.
- Sections 4 to 6 contain the specifications, organized in a series of audit worksheets.

The specifications are expressed as questions. Some questions are general in nature (for example, Do stairs have closed risers?). Others are more detailed (for example, Are riser heights no more than 125 mm (7 in.) high and no less than 180 mm (5 in.) high?).

## Some common measurements

Many of the specifications include measurements that take into account how people use mobility aids, such as wheelchairs and crutches. The following illustrations show some examples that auditors will need to understand. They include:

- Ramp slope
- Typical clear width for crutches
- Minimum turning radius for a manual wheelchair
- Height of reach of person in a wheelchair

## RAMP SLOPE

1:12 ratio (8.3%) or less is the minimum standard required by CSA (Canadian Standards Association).

1:20 ratio (5%) is recommended

**Note:** Various apps can quickly and easily calculate slope. For example, SLOPE is a simple iPhone app that provides slope percentage and slope ratio after the user enters a length, rise, and run.

## TYPICAL CLEAR WIDTH FOR CRUTCHES (in mm)

(in mm)

**Note:** The Nova Scotia Building Code requires a standard doorway to be 800 mm wide. However, a person using crutches typically needs 900 to 950 mm of clearance.

## MINIMUM TURNING RADIUS FOR A MANUAL WHEELCHAIR (in mm)

## HEIGHT OF REACH OF PERSON IN A WHEELCHAIR (in mm)

## Three core principles

The interim guidelines are grounded in three core principles:

- **Whole journey approach**—all parts of a journey are interlinked and equally important.  
A single obstacle can make it impossible to complete the journey, even if the rest of the way is accessible.
- **Universal design**—any environment should be designed to meet the needs of anybody wishing to use it, regardless of their age, size, ability, or disability.
- **Seasonal maintenance**—seasonal conditions, such as snow and ice, can create barriers to accessibility; seasonal maintenance can help to ensure that public spaces are accessible at all times.

In order to address the three core principles, the audit worksheets include the following questions for each feature (for example, for stairs or for transit stops):

- **Principle 1:** Does this feature follow the whole journey approach?
- **Principle 2:** Does this feature reflect the concept of universal design?
- **Principle 3:** Is there an adequate seasonal maintenance program for this feature?

These questions remind the auditor to think holistically about the overall accessibility of the site, beyond specific measurements and other technical details. The questions may not apply in every case.

The following section describes the three core principles in more detail.

## 2. A closer look at the three core principles

### Principle 1: Whole journey approach

The “whole journey approach” acknowledges that all parts of an accessible journey are interlinked and equally important (Evans 2009). A person’s journey typically includes a range of activities and destinations in a single trip.

It is important not to look at the accessibility of individual buildings or outdoor spaces in isolation, but to consider the accessibility of connected parts of buildings, spaces, and services from the perspective of a person using the facility. In other words, organizations must adopt a holistic approach when auditing their buildings and outdoor spaces. A single obstacle or element in the building can make it impossible to complete a journey, even if the rest of the building is accessible. For example, a small gap at the top of an accessible entrance ramp could make the ramp unusable for some people.

### Examples

Here are some examples of the whole journey approach in action:

- Signage and wayfinding, ramps, stairs, and handrails are strategically located to allow individuals of different size, age, and ability to easily manage a journey.
- Wide ramps (1500 mm, or 59 in. minimum) are placed in all pathway points that are not level, to allow people with a companion, service dog, or mobility aid to complete the journey.
- Accessible parking spaces are located close to the accessible entrances—usually no more than 30 metres, or 98 ft.
- In newer facilities, exterior pathways and entrances are designed with minimal level changes so that people of all abilities may easily enter or leave.
- Doors are avoided wherever possible or are as easy as possible to open.

## Principle 2: Universal design

Universal design is a concept that aims to ensure any environment can be accessed, understood, and used to the greatest extent possible by all people regardless of age, size, ability, or disability. In other words, an environment should be designed to meet the needs of anybody wishing to use it. Instead of focusing on specific dimensions of physical designs, universal design principles have the users and their usage as the core consideration.

The universal design concept was originally developed by North Carolina State University's Centre for Universal Design. It suggests the following seven principles to reflect the 'user and usage' perspectives (North Carolina State University 1997):

- **Equitable use.** The design is useful and marketable to people with diverse abilities.
- **Flexibility in use.** The design accommodates a wide range of individual preferences and abilities.
- **Simple and intuitive use.** Use of the design is easy to understand, regardless of the user's experience, knowledge, language skills, or current concentration level.
- **Perceptible information.** The design communicates necessary information effectively to the user, regardless of the user's sensory abilities.
- **Tolerance for error.** The design minimizes hazards and the adverse consequences of accidental or unintended actions.
- **Low physical effort.** The design can be used efficiently and comfortably and without the user getting too tired.
- **Size and Space for Approach and Use.** Appropriate size

and space is provided for approach, reach, manipulation, and use regardless of user's body size, posture, or mobility.

Universal design principles are often implicit in many design standards and guidelines, but accessibility audit tools do not always ask whether the site follows these concepts.

### Examples

Here are examples of the universal design principles in action:

- Signage and wayfinding provide the same information in different ways—pictograms, text, verbal, and tactile.  
**(Equitable Use)**
- Long hallways have handrails and resting places for people with low physical strength. **(Tolerance for Error and Low Physical Effort)**
- There are as many accessible parking stalls as possible beyond the minimum mandated by the building code. To reduce unauthorized use, the parking spaces are clearly marked with a combination of pictures, words and signs.  
**(Perceptible Information)**
- Garbage bins are no higher than 1060 mm (42 in.) so that small children and people in wheelchairs can use them.  
**(Equitable Use)**
- All doors have L- or U-shape handles for easy opening.  
**(Low Physical Effort)**
- Universal or family washrooms can be used by all genders, and they provide ample flexibility for people needing assistance, such as including the provision of adult change tables, so that people can attend to their personal needs in privacy and with dignity. There is at least one universal washroom on every occupied floor of a facility.  
**(Equitable Use)**

### Principle 3: Seasonal maintenance

Snow, ice, and rain are common in Nova Scotia for a significant portion of the year, and leaf litter can be a seasonal hazard. Therefore, outdoor spaces should be assessed during all seasons of the year and in all types of weather to ensure year-round standards of accessibility. It is important to know how accessibility is impacted after a snow, ice, or rain event so that everyone has equitable access to outdoor spaces.

#### Examples

Here are some examples of seasonal maintenance in action:

- Where there are slippery or inaccessible areas, a warning is provided using many different types of signage (using texts, pictures, symbols).
- Accessible parking spaces and adjacent access aisles are regularly maintained and kept clear of debris and snow.
- To prevent a slipping hazard from the ice and snow people might carry into a building on their clothes and boots, ice and snow are regularly cleared near the entrance. If door mats are used for clearing snow from boots, the mats are close to level with the floor so they do not become tripping hazards.

Slow snow removal makes the trip even harder.  
(Photo: Gerry Post)

### 3. Steps in the audit process

The audit process at a glance

- 1 Review**  
Review the interim guidelines.
- 2 Select**  
Select the sites to audit (e.g., streets, public washrooms, services, etc.).
- 3 Identify**  
Identify the audit worksheets you need.
- 4 Assemble**  
Assemble your audit tool belt—all the resources you might need at each site.
- 5 Rate**  
Rate each item.
- 6 Summarize**  
Summarize the ratings and note general observations.

#### Review the interim guidelines

The interim guidelines offer a structured but flexible way to complete an audit or series of audits, and to report the results.

Review the whole resource to understand how it works. In particular:

- Become familiar with the three core principles:
  - whole journey approach
  - universal design
  - seasonal maintenance
- Become familiar with some common measurements of accessibility, such as
  - the turning radius of a manual wheelchair
  - the height of reach for a person in a wheelchair
  - ramp slopes
- Review the worksheets in sections 4, 5, and 6.

To understand how the audit process supports accessibility planning, and where it fits in the planning cycle, refer to the *Accessibility Planning Toolkit for Municipalities* and the *Accessibility Planning Toolkit for Prescribed Public Sector Bodies*, available at [novascotia.ca/accessibility](http://novascotia.ca/accessibility).

## Select the sites to audit

Your organization may own or manage many buildings and outdoor spaces. It is probably not possible to audit all of these places at one time. The organization should prioritize the sites to be audited first, depending on the building's or site's purpose, the time allotted, and available resources.

The sites selected for your audit may also depend on the following considerations:

- Does the site serve many people?
- Are children, older adults, and people with disabilities frequent users of the site?
- Does the site provide services that community members use frequently?
- Is the site a place people use for assembly (e.g., community centres, theatres, libraries, and town halls)?
- Does the site host recreation, culture, and leisure activities (e.g., parks, promenades, and boardwalks)?

It is important to consult widely with the community and to involve community members in setting priorities.

## Identify the audit worksheets you need

Once you have decided which sites to audit first, select the worksheets you will need. It is helpful to use maps and floor plans to identify the types and number of features you will be auditing. For example:

- If you plan to audit a transit route, you might use a Google map to identify the transit stops. If there are seven transit stops, you will gather the information about each transit stop and then enter the combined results on worksheet 5.2.
- If you plan to audit a building, the floor plan will show some of the features you will encounter, such as the entrance (worksheet 6.1), the types and number of washrooms (worksheets 6.4.1 to 6.4.4), and the circulation within the building (worksheet 6.3).

## Assemble your audit tool belt

Here are some of the things you may want to bring when you visit a site:

- maps and floor plans identifying priority areas and features to be audited
- a copy of the Interim Accessibility Guidelines
- copies of the audit worksheets
- tape measure
- pen and clipboard
- camera

### ***To print your audit worksheets:***

Copy the pages from this document (sections 4, 5, and 6); **or** Go to Appendix B to download the worksheet files.

## Rate each item

Using the audit worksheets, answer the questions for each feature you selected to audit.

Score each question with one of the following:

3 points = Yes

2 points = Most of the time

1 point = Sometimes

0 points = No

Minus 3 points = Not applicable

(subtracted from the maximum possible score)

## Example

The table below outlines the scoring options for each question.

	Source	Yes (+ 3)	Most of the time (+ 2)	Some -times (+ 1)	No (0)	N/A (- 3)	Comments
4.1.c	Is signage consistently located?	CSA B651-18 (4.5.1.a)					

**Note:** If a building has many examples of a feature (e.g., many handrails or several washrooms), you will not need a separate worksheet for each example. Instead, using the worksheet as a guide, you may gather the information for all of the examples and then report the overall findings on a single worksheet. For example, if some washrooms in a building are equipped with power door operators, but others are not, you may score 1 point for the power door question.

You are encouraged to use the Comments field in the following ways.

- Note the measurements of an item.
- Provide other details related to conditions of the items.
- Note that the site performed exceptionally well, or exceptionally poorly—to celebrate successes or draw attention to areas needing improvement.
- Comment on why you chose the rating.
- Indicate if you have taken photographs of the feature to support the evaluation.

## Summarize the ratings and note general observations

At the end of each worksheet, you can add up the scores and compare the sum to the maximum possible score for that feature. The maximum possible score for a worksheet equals the number of questions x 3.

### Example

In the following simplified example, the maximum possible score is 9 (3 questions x 3 points each).

Source	Yes (+ 3)	Most of the time (+ 2)	Some -times (+ 1)	No (0)	N/A (- 3)	Comments
Is the crosswalk at least 1800 mm (31 in.) wide between pavement markings?	<b>3</b>					
Does the crosswalk include a tactile indicator where the curb slopes to the roadway?			<b>1</b>			<b>Snow clearing not effective; tactile surface partially buried</b>
If the intersection includes both traffic light and sidewalk, does it employ a distinct audible indication for each discrete direction of travel?				<b>0</b>		
	Subtotal	Subtotal	Subtotal	Subtotal		<b>Final Total</b>
	<b>3 +</b>	<b>0 +</b>	<b>1 +</b>	<b>0</b>		<b>= 4 out of 9</b>

\* If you answer N/A (not applicable) for any question, deduct that question from the maximum possible score. For example, if there are three questions and you answer N/A for one, the maximum possible score would be 6, not 9 (3 questions x 3 points each - 3 for the n/a).

## Example

Source	Yes (+ 3)	Most of the time (+ 2)	Some -times (+ 1)	No (0)	N/A (- 3)*	Comments
Is the crosswalk at least 1800 mm (31 in.) wide between pavement markings?	<b>3</b>					
Does the crosswalk include a tactile indicator where the curb slopes to the roadway?			<b>1</b>			<b>Snow clearing not effective; tactile surface partially buried</b>
If the intersection includes both traffic light and sidewalk, does it employ a distinct audible indication for each discrete direction of travel?					<b>- 3</b>	<b>No traffic light</b>
					Subtotal	Max. score
					<b>- 3 +</b>	<b>9 = 6</b>
Subtotal				Subtotal	Final Total	
<b>3 +</b>				<b>0 +</b>	<b>= 4 out of 6</b>	
				<b>1 +</b>		
				<b>0</b>		

\* Subtract your N/A subtotal from the maximum possible score

There are many ways to report the results. For example:

- Compare scores of the same items (e.g., washrooms) across different sites to identify which sites require improvement, also taking into account the types of users and user traffic.
- Average the scores of the same items across sites (e.g., washrooms in each of the organization's buildings) to assess general levels of accessibility for that item.
- Compare the site-specific scores or overall averages over time (e.g., score improvements in library washrooms between 2020 and 2022).

The audit findings offer concrete evidence to support budgeting, annual and long-range planning, accessibility awareness for staff and the public, and more.

***The Accessibility Directorate aims to continually improve these guidelines, and welcomes your feedback. Please send your feedback to [accessibility@novascotia.ca](mailto:accessibility@novascotia.ca).***

## Part 2: Work Sheets

### 4. Common elements (indoor and outdoor)

Worksheets

4.1 Signage and wayfinding

4.2 Ramps

4.3 Stairs

4.4 Handrails

4. Common elements (indoor and outdoor)

## 4.1 Signage and wayfinding

**Location:**

**Date and time:**

**Auditor:**

**Description:**

Signs are the main way of communicating direction, location, safety, or form of action. Wayfinding describes the ways to help people find their way through touch, print, signage, and architecture or landscaping.

Effective signage and wayfinding communicate necessary information to the user, regardless of indoor or outdoor conditions or the user’s sensory abilities. Signage uses different modes (pictogram, verbal, tactile) to present essential information in many ways.

	Source	Yes (+ 3)	Most of the time (+ 2)	Some -times (+ 1)	No (0)	N/A (- 3)*	Comments
<b>4.1.a</b>	Does the facility have interior signage?						
<b>4.1.b</b>	Is the International Symbol of Access used to identify accessible access when required—washrooms, main entrances, elevators?   (Source: Federal Highway Administration, US Department of Transportation)						

chart continued on next page →

		Yes (+ 3)	Most of the time (+ 2)	Some -times (+ 1)	No (0)	N/A (- 3)*	Comments

## 4.4 Handrails

Location:

Date and time:

Auditor:

Description:

Handrails and guards are typically provided at ramps, stairs, terraces, and elevated viewing platforms in both interior and exterior environments.

Example of handrails on both sides of stairs along a wall (4.4.a), showing rail colour contrast against the wall (4.4.c), and rails at the specified height (4.4.d). Handrails also shown extending to areas before and after the stairs at the specified length (4.4.e), with rounded shape for easy grasping.

	Source	Yes (+ 3)	Most of the time (+ 2)	Some -times (+ 1)	No (0)	N/A (- 3)*	Comments
<b>4.4.a</b> Are handrails on both sides?	CSA B651-18 (5.5.8)						
<b>4.4.b</b> Are handrails continuous and around landings?	CSA B651-18 (5.5.8b)						
<b>4.4.c</b> Are handrails colour-contrasted with the surrounding wall surface?	CSA B651-18 (5.5.8c)						
<b>4.4.d</b> Do handrails have a height between 860 mm and 920 mm (34–36 in.), measured from the stair surface to the top of the rail?	CSA B651-18 (5.5.8e)						
<b>4.4.e</b> Do handrails extend beyond the top and bottom of the ramp at least 300 mm (12 in.)?	CSA B651-18 (5.5.8f.i)

## 5.1.1 Sidewalks and walkways

**Location:**

**Date and time:**

**Auditor:**

**Description:**

Sidewalk conditions can be assessed by walking the sidewalk section and noting cracks, misaligned sidewalk slabs, tree root damage, and gaps in utility grates or grilles (CSA B651-18, 4.3.4).

Example of an accessible pedestrian route in a high traffic area providing the minimum specified width (5.1.1.a). The grating is oriented in the direction of travel and has spacings that are a maximum of 13mm wide in one direction (5.1.1.d.i).

## 5. Outdoor public spaces

### 5.3 Parking

Location:

Date and time:

Auditor:

Description:

Parallel parking can be dangerous for people with limited mobility or a disability because oncoming traffic is likely traveling faster than in a parking lot. Accessible parking spaces should be designed to make room for service dogs, companions, and mobility aids.

An accessible parking space that is at least 2600 mm wide (5.3.b), has an adjacent access aisle that is at least 2000 mm (5.3.c), and is clearly identified as being for the use of people with physical disabilities (5.3.d)

Image showing the minimum length of a parallel parking stall and the space between the stall and the pathway to the sidewalk. (5.3.f)

**Table 3.8.2.5 from the NSBC  
DESIGNATED PARKING STALLS**

## 6. Indoor public spaces

### 6.1 Entrance and approach

**Location:**

**Date and time:**

**Auditor:**

**Description:**

Entrance refers to all access points into a building and the exterior pathway to the entrance. This includes sidewalks and walkways, ramps, and stairs along the routes that connect pedestrians to the building site and the building entrance. Consider routes from arrival points such as parking, drop-off areas, public streets and sidewalks, and public transit stops.

Refer to the following worksheets for related details: 4.1 Signage and wayfinding; 4.2 Ramps; 4.3 Stairs; 4.4 Handrails; and 5.1.1 Sidewalks and walkways.

A building where the main entrance is easy to find, with a clear contrast between the door and the façade (6.1.a). The entrance is close to the accessible drop-off area. Accessible parking is provided (6.1.e.), adjacent to an accessible ramp, (6.1.g). A bench is provided nearby (6.1.i).

## 6. Indoor public spaces

### 6.4 Public washrooms

**Location:**

**Date and time:**

**Auditor:**

**Description:**

This worksheet applies to washroom facilities including, but not limited to:

- multiple-occupancy washrooms with multiple stalls, accessible stalls, and limited mobility stalls for independent use
- universal or family washrooms, which allow for assisted use.

A washroom providing clear entrance signs to indicate that it is accessible (6.4.b.ii) (Photos: Cities and Environment Unit)

A well-lit washroom (6.4.f) (Photos: Cities and Environment Unit)

A Universal washroom that provides a minimum of 1700 mm on all sides. The diagram on the next page shows a Universal washroom at the preferred size of 2500 mm wide (6.4.g.ii) so that fixtures like an accessible toilet (6.4.g.iv), adult change table (6.4.h.i), and other amenities (6.4.g.v) fit comfortably for use. An unobstructed turning radius of 1700 mm allows for easier navigation in the space (6.4.g.iii) and an emergency call system is available should a user require assistance (6.4.h.vi). (Image: Cities and Environment Unit)

## UNIVERSAL WASHROOM

### UNIVERSAL WASHROOM

A plan showing at least one fully accessible washroom stall (6.4.i.i) and one wider stall for people with limited mobility (6.4.i.ii) in a multiple occupancy washroom. The doors to these stalls should open outward (6.4.i.iv). Ideally, the accessible stall and the pathways to this stall should be wide enough to accommodate at least a 1500 mm turning radius for a wheelchair user.

**Principle 1**

Does this feature follow the whole journey approach?

**Principle 2**

Does this feature follow the concepts of universal design?

**Principle 3**

Is there an adequate seasonal maintenance program for this feature?

## 6.5.4 Assistive listening devices

**Location:**

**Date and time:**

**Auditor:**

**Description:**

Assistive listening systems should be used in areas where people assemble. This includes—but is not limited to—classrooms, auditoriums, meeting rooms, and theatres with

- an area of 100 square metres; or
- 75 or more fixed seats; and/or
- installed speakers

	Source	Yes (+ 3)	Most of the time (+ 2)	Some -times (+ 1)	No (0)	N/A (- 3)*	Comments	
6.5.4.a	Is the space equipped with any assistive listening system?	NSBC (3.8.2.9)						
6.5.4.b	Does the system perform with the use of hearing aids or headphones?	NSBC (3.8.2.9)						
6.5.4.c	Does the system work throughout the space?	OADS (5.2.1)						
6.5.4.d	Does the system provide volume control?	OADS (5.2.1)						
6.5.4.e	Is signage provided with the International Symbol for Hearing Loss pictogram to identify the availability of the assistive listening system—marked with a “T” and with T-coil where T-coil usage is available?	OADS (5.2.1)

### Common elements (indoor and outdoor)

- 4.1 Signage and wayfinding
- 4.2 Ramps
- 4.3 Stairs
- 4.4 Handrails

### Outdoor public spaces

- 5.1.1 Sidewalks and walkways
- 5.1.2 Curb ramps
- 5.1.3 Street crossings (crosswalks)
- 5.2 Transit stops
- 5.3 Parking
- 5.4.1 Trails
- 5.4.2 Parks and playgrounds
- 5.5.1 Waste receptacles
- 5.5.2 Picnic tables
- 5.5.3 Seating

### Indoor public spaces

- 6.1 Entrance and approach
- 6.2 Interior doors and doorways
- 6.3 Circulation
- 6.4 Public washrooms
- 6.5.1 Interior wayfinding (used in conjunction with 4.1, which is more detailed)
- 6.5.2 Reception area and service counter
- 6.5.3 Emergency systems
- 6.5.4 Assistive listening devices
